### To Fly

Salamanders are equally important as food for many other animals, such as raccoons, opossums, bears, mink, river otter, frogs and snakes. In some places they are the most abundant vertebrate animals in the forest. They are also important as biological indicators as their porous skin is sensitive to environmental toxins. Since many live in both aquatic and terrestrial habitats, scientists use them to monitor for problems in the environment.

Most of Tennessee's salamanders have a biphasic life cycle, meaning they spend part of their life in a tadpole-like larval stage then morph into the adult stage. Many species of salamanders spend their adult stage on land in moist habitats near water. Then during the breeding period, the adult salamanders move into the breeding ponds to court and lay eggs. Spotted salamanders are well known for their mass migrations in the spring as they move from their forest habitat to their breeding ponds. Salamanders require ponds that have no fish in them as "Fish Eat Amphibians!" Temporary ditches, road ruts, flooded fields, wet depressions and semi-permanent to permanent ponds are all favorable breeding habitat. A few species, like the pigmy salamander and seepage salamander, skip the larval stage and the eggs hatch into perfect miniatures of the adults. While most salamanders lay their eggs and then depart, some species like the green and marbled salamanders stay and guard their eggs to help protect them from small predators and fungus.

What are some of the major challenges facing salamanders today? As more and more people use more resources and require more places to live, habitat destruction and modification are occurring at an alarming rate and are the greatest threats facing salamanders. Another major problem salamanders face is habitat fragmentation; salamanders are unable to move freely between populations or even reach their breeding ponds because of highways and other construction. Introduced species can negatively affect salamanders by direct predation and competition. Chemicals such as pesticides, herbicides, and fertilizers are adversely affecting salamanders in many areas around the world. Other factors that may negatively affect salamanders in Tennessee are climate change, disease and collection for the pet trade even though it is illegal to remove any native animal from the wild in Tennessee.

## Salamanders

In 1995, in recognition of Tennessee's unique natural heritage, the state legislature designated the Tennessee cave salamander as our official State Amphibian. You may be wondering, "What are salamanders and why are they important?" Salamanders are the group of animals, including newts, sirens and amphiumas, that have smooth, moist, porous skin, lay jelly-like eggs and have a long tail. Often they are mistakenly referred to as "spring lizards," when in fact they belong to the group of animals known as amphibians. Unlike lizards, a type of reptile, salamanders lack scales on the body, do not have claws on the toes, and cannot survive far from moisture.

Salamanders are nocturnal and come out from their hiding places during moist nights to hunt for prey. Most species eat large amounts of invertebrates such as worms, insects and snails. A few species, like spring and red salamanders, will even eat other salamanders.
